

Foundation of Management (FoM)

Several strategic principles

1. The FoM Journal publishes research programs and research results in all areas of management.

2. The following aspects of publications are highly appreciated:

- focusing on models formalizing phenomena in business, security, or in technological issues;
- presenting simulation models, statistical methods, game theory, fuzzy sets and approximate sets, dynamic and object programming, and/or the use of specialized techniques and information systems;
- theoretical issues and results of research applied in the areas and disciplines of science devoted to the issues of security, civilization and technology in countries with high dynamics of economic and social development;
- perfect, factual and qualitatively developed results with universal theoretical and praxeological values, including in particular those devoted to modern trends and philosophical paradigms of contemporary management theories.

3. The FoM Journal prefers articles with an international participation of authors with a transparent formula of funding research and research projects, reviewed by the representatives of highly ranked academic centers and research institutions.

4. The FoM Journal is reluctant to publish a survey material or material derived from superficially surveyed surveys, based on artificially formulated hypotheses, always true theses, syllogisms, or research questions constructed for an ambitious cause for publication.
